

# Finite Automata Theory and Formal Languages

## Föreläsning 2 - Central concepts of automata theory

Erik Sjöström

March 22, 2016

### 1 Alphabets

**Definition 1.1.** *An alphabet is a finite, non-empty set of symbols, usually denoted by  $\Sigma$ . The number of symbols in  $\Sigma$  is denoted as  $|\Sigma|$ .*

**Notation.** *We will use  $a, b, c, \dots$  to denote symbols.*

**Anmärkning.**  
*Alphabets will represent the observable events of the automata.*

#### Exempel 1.1.

*Some alphabets:*

- *on/off-switch:*  $\Sigma = \{Push\}$
- *simple vending machine:*  $\Sigma = \{5\text{ kr}, choc\}$
- *complex vending machine*  $\Sigma = \{5\text{ kr}, 10\text{ kr}, choc, big\ choc\}$
- *parity counter*  $\Sigma = \{p_0, p_1\}$

### 2 Strings or Words

**Definition 2.1.** *Strings/Words are finite sequences of symbols from some alphabet.*

**Notation.** *We will use  $w, x, y, z, \dots$  to denote words.*

**Anmärkning.**  
*Words will represent the behaviour of an automaton.*

#### Exempel 2.1.

*Some behaviours:*

- *on/off-switch:*  $Push, Push, Push, Push$
- *simple vending machine:*  $5\text{ kr}, choc, 5\text{ kr}, choc, 5\text{ kr}, choc$
- *parity counter:*  $p_0p_1$  or  $p_0p_0p_0p_1p_1p_0$

**Anmärkning.**  
*Some words do NOT represent behaviour*

**Exempel 2.2.**

*simple vending machine: choc, choc, choc*

### 3 Inductive Definition of $\Sigma^*$

**Definition 3.1.**  $\Sigma^*$  is the set of all words for a given alphabet  $\Sigma$ .

This can be described inductively in at least 2 different ways:

- Base case:  $\epsilon \in \Sigma^*$
- Inductive step: if  $a \in \Sigma$  and  $x \in \Sigma^*$  then  $ax \in \Sigma^*$
- We will usually work with this definition.

Or:

- Base case:  $\epsilon \in \Sigma^*$
- Inductive step: if  $a \in \Sigma$  and  $x \in \Sigma^*$  then  $xa \in \Sigma^*$

We can (recursively) *define* functions over  $\Sigma^*$  and (inductively) *prove* properties about those functions.

### 4 Concatenation

**Definition 4.1.** Given the string  $x$  and  $y$ , the concatenation  $xy$  is defined as:

$$\begin{aligned}\epsilon y &= y \\ (ax')y &= a(x'y)\end{aligned}$$

Observe that in general  $xy \neq yx$

**Exempel 4.1.**

If  $x = 010$ , and  $y = 11$ , then  $xy = 01011$ , and  $yx = 11010$

**Lemma.** If  $\Sigma$  has more than one symbol then concatenation is not commutative.

### 5 Prefix and Suffix

**Definition 5.1.** Given  $x$  and  $y$  words over a certain alphabet  $\Sigma$ :

- $x$  is a **prefix** of  $y$  iff there exists  $z$  such that  $y = xz$
- $x$  is a **suffix** of  $y$  iff there exists  $z$  such that  $y = zx$

**Anmärkning.**

$\forall x, \epsilon$  is both a prefix and suffix of  $x$ .

**Anmärkning.**

$\forall x, x$  is both a prefix and suffix of  $x$ .

### 6 Length and Reverse

**Definition 6.1.** The **length** function  $|\cdot| : \Sigma^* \rightarrow \mathbb{N}$  is defined as:

$$\begin{aligned}|\epsilon| &= 0 \\ |ax| &= 1 + |x|\end{aligned}$$

**Exempel 6.1.**  
 $|01010| = 5$

**Definition 6.2.** The *reverse* function  $rev( ) : \Sigma^* \rightarrow \Sigma^*$  is defined as:

$$\begin{aligned} rev(\epsilon) &= \epsilon \\ rev(ax) &= rev(x)a \end{aligned}$$

**Exempel 6.2.**  
 $rev(a_1 \dots a_n) = a_n \dots a_1$

## 7 Power

### 7.1 Of a string

**Definition 7.1.** We define  $x^n$  as follows:

$$\begin{aligned} x^0 &= \epsilon \\ x^{n+1} &= xx^n \end{aligned}$$

**Exempel 7.1.**  
 $(010)^3 = (010010010)$

### 7.2 Of an alphabet

**Definition 7.2.** We define  $\Sigma^n$ , the set of words over  $\Sigma$  with length  $n$ , as follows:

$$\begin{aligned} \Sigma^0 &= \{\epsilon\} \\ \Sigma^{n+1} &= \{ax \mid a \in \Sigma, x \in \Sigma^n\} \end{aligned}$$

**Exempel 7.2.**  
 $\{0, 1\}^3 = \{000, 001, 010, 011, 100, 101, 110, 111\}$

**Notation.**

$$\begin{aligned} \Sigma^* &= \Sigma^0 \cup \Sigma^1 \cup \Sigma^2 \dots \\ \Sigma^+ &= \Sigma^1 \cup \Sigma^2 \cup \Sigma^3 \dots \end{aligned}$$

## 8 Some properties

The following properties can be proved by induction:

**Lemma.** Concatenation is associative:  $\forall x, y, z: x(yz) = (xy)z$

**Lemma.**  $\forall x: x\epsilon = \epsilon x = x$

**Lemma.**  $\forall x: |x^n| = n * |x|$

**Lemma.**  $\forall \Sigma: |\Sigma| = |\Sigma|^n$

**Lemma.**  $\forall x: rev(rev(x)) = x$

**Lemma.**  $\forall x, y: rev(xy) = rev(y)rev(x)$

## 9 Languages

**Definition 9.1.** Given an alphabet  $\Sigma$ , a *language*  $\mathcal{L}$  is a subset of  $\Sigma^*$ , that is,  $\mathcal{L} \subseteq \Sigma^*$

**Anmärkning.**

If  $\mathcal{L} \subseteq \Sigma^*$  and  $\Sigma \subseteq \Delta$  then  $\mathcal{L} \subseteq \Delta^*$

**Anmärkning.**

A language can be either finite or infinite.

**Exempel 9.1.**

Some languages:

- Swedish, English, French, Spanish...
- Any programming language
- $\emptyset$ ,  $\{\epsilon\}$ , and  $\Sigma^*$  are languages over any  $\Sigma$
- The set of prime Natural numbers:  $\{1, 3, 5, 7, 11, \dots\}$

## 10 Some Operations on Languages

**Definition 10.1.** Given  $\mathcal{L}, \mathcal{L}_1, \mathcal{L}_2$  languages, we define the following languages:

- **Union, intersection:** The same as for any set.
- **Concatenation:**  $\mathcal{L}_1\mathcal{L}_2 = \{x_1x_2 \mid x_1 \in \mathcal{L}_1, x_2 \in \mathcal{L}_2\}$
- **Closure:**  $\mathcal{L}^* = \bigcup_{n \in \mathbb{N}} \mathcal{L}^n$  where  $\mathcal{L}^0 = \{\epsilon\}$ ,  $\mathcal{L}^{n+1} = \mathcal{L}^n\mathcal{L}$

**Anmärkning.**

$$\emptyset^* = \{\epsilon\}$$

$$\mathcal{L}^* = \mathcal{L}^0 \cup \mathcal{L}^1 \cup \mathcal{L}^2 \cup \dots = \{\epsilon\} \cup \{x_1 \dots x_n \mid n > 0, x_i \in \mathcal{L}\}$$

**Notation.**  $\mathcal{L}^* = \mathcal{L}^1 \cup \mathcal{L}^2 \cup \mathcal{L}^3 \cup \dots$

**Exempel 10.1.**

Let  $\mathcal{L} = \{aa, b\}$ , then

$$\mathcal{L}^0 = \{\epsilon\}$$

$$\mathcal{L}^1 = \mathcal{L}$$

$$\mathcal{L}^2 = \mathcal{L}\mathcal{L} = \{aaaa, aab, baa, bb\}$$

$$\mathcal{L}^3 = \mathcal{L}^2\mathcal{L}$$

$$\vdots$$

$$\mathcal{L}^* = \{\epsilon, aa, b, aaaa, aab, baa, bb, \dots\}$$

## 11 How to Prove the Equality of Languages?

Given the languages  $\mathcal{L}$  and  $\mathcal{M}$ , how can we prove that  $\mathcal{L} = \mathcal{M}$

A few possibilities:

- Languages are sets so we prove that  $\mathcal{L} \subseteq \mathcal{M}$  and  $\mathcal{M} \subseteq \mathcal{L}$
- Transitivity of equality:  $\mathcal{L} = \mathcal{L}_1 = \dots = \mathcal{L}_m = \mathcal{M}$
- We can reason about the elements in the language:

**Exempel 11.1.**

$\{a(ba)^n \mid n \geq 0\} = \{(ab)^n a \mid n \geq 0\}$  can be proved by induction on  $n$ .

## 12 Algebraic Laws for Languages

Laws of concatenation:

- Associativity:  $\mathcal{L}(\mathcal{M}\mathcal{N}) = (\mathcal{L}\mathcal{M})\mathcal{N}$
- Not commutative:  $\mathcal{L}\mathcal{M} \neq \mathcal{M}\mathcal{L}$
- Distributivity:  $\mathcal{L}(\mathcal{M} \cup \mathcal{N}) = \mathcal{L}\mathcal{M} \cup \mathcal{L}\mathcal{N}$
- Distributivity:  $(\mathcal{M} \cup \mathcal{N})\mathcal{L} = \mathcal{M}\mathcal{L} \cup \mathcal{N}\mathcal{L}$
- Identity:  $\mathcal{L}\{\epsilon\} = \{\epsilon\}\mathcal{L} = \mathcal{L}$
- Annihilator:  $\mathcal{L}\emptyset = \emptyset\mathcal{L} = \emptyset$
- Other Rules:
  - $\emptyset^* = \{\epsilon\}^* = \{\epsilon\}$
  - $\mathcal{L}^+ = \mathcal{L}\mathcal{L}^* = \mathcal{L}^*\mathcal{L}$
  - $(\mathcal{L}^*)^* = \mathcal{L}^*$

**Anmärkning.**

While:

$$\mathcal{L}(\mathcal{M} \cap \mathcal{N}) \subseteq \mathcal{L}\mathcal{M} \cap \mathcal{L}\mathcal{N}$$

and

$$(\mathcal{M} \cap \mathcal{N})\mathcal{L} \subseteq \mathcal{M}\mathcal{L} \cap \mathcal{N}\mathcal{L}$$

both hold, in general

$$\mathcal{L}\mathcal{M} \cap \mathcal{L}\mathcal{N} \subseteq \mathcal{L}(\mathcal{M} \cap \mathcal{N})$$

and

$$\mathcal{M}\mathcal{L} \cap \mathcal{N}\mathcal{L} \subseteq (\mathcal{M} \cap \mathcal{N})\mathcal{L}$$

don't.

**Exempel 12.1.**

Consider the case where:

$$\mathcal{L} = \{\epsilon, a\}, \mathcal{M} = \{a\}, \mathcal{N} = \{aa\}$$

Then

$$\mathcal{L}\mathcal{M} \cap \mathcal{L}\mathcal{N} = \{aa\}$$

but

$$\mathcal{L}(\mathcal{M} \cap \mathcal{N}) = \mathcal{L}\emptyset = \emptyset$$

## 13 Functions between Languages

**Definition 13.1.** A function  $f : \Sigma^* \rightarrow \Delta^*$  between 2 languages should satisfy:

$$\begin{aligned}f(\epsilon) &= \epsilon \\f(xy) &= f(x)f(y)\end{aligned}$$

Intuitively,  $f(a_1 \dots a_n) = f(a_1) \dots f(a_n)$

**Anmärkning.**

$f(a) \in \Delta^*$  if  $a \in \Sigma$
